### Challenge

In November the Stage Theater in Hamburg celebrated its opening. With its twelve-metre-high reflective façade of stainless steel slates, it offers a constantly changing aspect. The building should be integrated into the planned lighting show.

### Special requirements

- The building of the Stage Theater should be integrated into the lighting show
- High luminosity and colour brilliance
- Shipping on the Elbe was brought to a standstill for a quarter of an hour

### LOCATION

Hamburg, Germany

### DATE

November 2014

### Realisation

AO Lighting supplied its newly launched FALCON BEAM 2 searchlights for their first live application on the banks of the Elbe. The lighting designer Jerry P. Appelt integrated the searchlights into the lighting concept by installing some in four groups at the foot of the building along the riverside, whilst the main group was hoisted by cranes onto the roof of the new building. In this configuration, the searchlights projected light images visible from afar amid the play of fireworks and laser beams. Particularly magnificent was a still image: a crown composed of light beams that adorned the roof of the theatre.

### Result

The searchlights push events optically and guarantee increased awareness throughout the surrounding area. Especially it was the brilliance of the colours and the luminosity that most impressed everyone involved.

The FALCON BEAM 2 proved on this its first outing that it is the ideal fixture for this type of show format. The searchlight with its colour changer is notable for its brilliance and power as well as its reduced power consumption and compact design. Rapid zooming and fast pan and tilt movements allow lighting designers to realize fluid, soft sequences of movements. With its prolonged service life, low maintenance costs and highly efficient optics, the FALCON BEAM 2 is a must for the equipment lists of all future events.

LIGHTS TO REMEMBER
